performed if the 4Dx test is positive for Añapíasma, Ehrlichia, or Lyme Disease. To be eligible for rescheduling, proof of completed treatment for the tick-borne disease is required, or the negative results from a 4Dx be performed offsite. If your pet has a long hair coat and ticks are not noticed until after premedication/induction, there will be an additional sedation charge if the surgery is not performed. This new policy protects for pet from elective procedures if they have a potential tick-borne disease that can increase the risk of bleeding.  I understand that if my male dog has long hair, the underside of the tail will be shaved to help prevent complications.  I understand that procedures requiring additional surgical time will incur additional fees (pregnant, cryptorchid, pyometra, obesity, previous abdominal surgeries, unattached dewclaw removal). These fees apply to all clients, including recipients of free or reduced-cos surgeries.  I understand that if my animal is pregnant, the pregnancy will be terminated at the time of surgery. I understand that there will be additional fees for this procedure. These fees apply to all clients, including recipients of free or reduced-cost surgeries.  I understand that the SAHS and/or any SAHS party has the right to refuse any service and/or procedure to any animal for any reason. Including, but not limited to, situations where surgery is deemed a health risk. Such refusal is at the sole discretion of the attending veterinarian.  I understand that if my pet is deemed unsafe to handle and the surgery technician cannot perform a pre-operative exam—including, bu not limited to, checking temperature, heart auscultation, and respiratory rate—my pet's surgery will be denied. This policy is in place for the safety of both the pet and the staff. The San Antonio Humane Society (SAHS) is a high-volume spay and neuter clinic. If your pet is deemed unsafe to handle, the SAHS will deduct stist. Out form the refund if your pet's surgery will be denied. This policy is in place f

## SPAY/NEUTER DISCHARGE INSTRUCTIONS

IT IS <u>CRITICAL</u> THAT YOU FOLLOW THESE INSTRUCTIONS TO AVOID SERIOUS AND COSTLY POST-SURGICAL COMPLICATIONS.

#### DO NOT SCHEDULE SURGERY IF YOU ARE UNABLE TO COMPLY WITH THESE INSTRUCTIONS!

THE SAHS STRONGLY RECOMMENDS ESTABLISHING A REGULAR RELATIONSHIP WITH A **FULL-SERVICE VETERINARY HOSPITAL** TO MEET YOUR PET'S ONGOING HEALTH CARE AND DISEASE PREVENTION NEEDS.

#### POST-OP INSTRUCTIONS - PLEASE READ, INITIAL EACH LINE, AND SIGN

#### **INCISION SITE CARE:**

- Your pet has undergone a major surgery. The incision site has been closed and a **silver aerosol bandage** has been applied over the incision site. **Green tattoo ink** has been applied to the skin to identify that your pet has been spayed/neutered.
- · We perform scrotal neuters. It is normal to see a slight opening of the incision and some tinged fluid post-operatively.
- Please keep the incision site clean, dry (no baths!), and unbandaged until healed.

#### **E-COLLARS:** Recommended for all surgical procedures!

• **REQUIRED** for all pets with **external sutures/staples** and **all dogs over 25 pounds**. Please use a regular collar to secure the cone once you have returned home. E-collars should fit snug around the neck (so you can only place two fingers underneath) and extend several inches past the nose. These should be worn for a minimum of 7 - 10 days.

#### **STRICT REST:** Recommended after all surgical procedures (except ferals)!

- **DOGS:** We recommend dogs be confined to a kennel until the incision has healed. Dogs should be walked on a leash to use the restroom and not be allowed to run, jump, or play. DO NOT bathe your dog for 14 days post-surgery.
- CATS: Anesthesia may wear off slowly, so your pet may appear drowsy this evening, but they will become progressively more active and alert with time. Cats may sleep and wake up several times throughout the night and are often clumsy. Cats may hallucinate as anesthesia wears off and sounds, light, and touching may frighten them. They may growl or claw at invisible objects for up to 24 hours. Keep cats confined in their carriers this evening and make sure they are in a quiet place and avoid stress and stairs when possible. Some cats do best in quiet, dark places such as a bathroom (with the toilet lid down).

#### APPETITE/RESTROOM HABITS

- Your pet might not be interested in food tonight. Expect your pet to have an initial decrease in appetite which should return
  gradually within 24-48 hours following surgery. Some pets experience residual nausea following anesthesia. Offer small
  amounts of water immediately after returning home, and then small amounts of food later in the day or the next morning.
   This also means a decrease in urine and bowel production for several days.
- One episode of vomiting or diarrhea can be normal after anesthesia. Multiple episodes of vomit/diarrhea with or without blood are NOT normal and usually NOT caused by the anesthesia. We recommend you see your regular veterinarian or an emergency clinic (if after hours) for any severe episodes of vomiting and/or diarrhea. The SAHS cannot treat these issues.

#### **FERTILITY POST-OP**

- · Newly neutered males may remain marginally fertile and may breed for 3-4 weeks after surgery, so please keep them confined.
- Female pets that have surgery while in heat are especially delicate and must be kept separate from males (both neutered and unneutered) for 5 days after surgery. Some of these animals will continue to breed, potentially damaging their incision.

#### **RE-CHECK INFO**

Email concerns/photos to **medical@SAhumane.org**. If you are told to come in, recheck hours at our Leeu Naylor Medical Building are Monday-Friday between 9am-1pm.

Please note this email is only being monitored during routine business hours.

Seek emergency care for your pet if you are concerned and it is outside of routine business hours.

#### **MEDICATIONS**

TRAZODONE (anti-anxiety and mild sedative medication used in highly energetic dogs in postoperative period):

- Your pet has been prescribed Trazodone to help reduce their anxiety following their surgery. This medication is generally
  well-tolerated in dogs but some dogs can experience side effects including: aggressive food searching, sedation, nausea,
  and diarrhea. Please discontinue the medication and contact the SAHS or seek veterinary care if these signs develop. If
  your pet continues to be hyperactive with the medication, please contact the SAHS (medical@SAhumane.org) as the dose
  may need to be adjusted.
- · Please administer according to the label instructions.

#### **CARPROFEN** (dogs only):

- An additional 3 days of pain control is recommended. This is a member of the class of drugs known as NSAIDs
   (non-steroidal anti-inflammatory drugs). Your dog has already been administered a 24-hour dose of this medication
   pre-operatively and does not need another dose until tomorrow morning. The most common side effects to watch for are
   stomach upset: vomiting, diarrhea, and/or appetite loss. This medication is to be given preferably with food.
   (Note: Small dogs may be prescribed a once daily dosage or meloxicam instead)
- Dose: 2.2mg/kg dose every 12 hours to start the morning following surgery has been prescribed. Administer according
  to instructions on the label(s). Note that you may be instructed to administer tablets from multiple bottles to achieve
  the total dose.

#### **ANTIBIOTICS**

• If your pet has been administered an injectable antibiotic, the specific dose and type will appear on the following page. If your pet has been prescribed oral antibiotics, follow all dosing instructions on the label. Antibiotics are generally well-tolerated, but most common side effects include GI upset: vomiting, diarrhea, loss of appetite. We recommend giving this medication with food to reduce chance of side effects.

#### **CAT-SPECIFIC MEDICATIONS**

- Cats receive a 24-hour injectable dose of an anti-inflammatory (Meloxicam) immediately following surgery.
- An additional pain medication of injectable Buprenorphine SR or transdermal Zorbium is also recommended for all cats undergoing surgery at an additional cost.
  - Buprenorphine SR is an injectable opioid given immediately following surgery that lasts for approximately 72 hours.
  - Zorbium (Buprenorphine) is a transdermal opioid that delivers four days of reliable pain relief from a single in-clinic dose. This medication is applied to the skin at the back of the head.

#### **EXTERNAL SKIN SUTURES**

- Your pet may have received external skin sutures or staples if surgery required a larger incision or if there are concerns about your pet's post-operative activity level (too active).
- If your pet received staples or external skin sutures, please return in 10-14 days for staple/suture removal.
- · If your pet had a drain placed during surgery (scrotal ablation), please return in 3 days for recheck and drain removal.

## **POST-OPERATIVE CONCERNS?**

# If you have any post-operative concerns, email our Medical Front Desk (medical@SAhumane.org)

Please include a clear photo of your pet's incision and answers to the following questions:

- · When did your pet have surgery?
- Has your pet been wearing an e-collar?
- · Has your pet been allowed to lick at the incision?
- · Has your pet been allowed to exercise since surgery?
- Has your pet been eating/drinking/urinating/defecating normally?
- Have you noticed any discharge/bruising/swelling/bleeding from the incision?
- · Have you noticed that the incision is open?

Our medical front desk staff will send a reply as soon as possible.

Please note that this email is only monitored during regular business hours! If there is an emergency, please seek veterinary care immediately.

If medical front desk staff is unable to answer your email, they will forward it to a staff veterinarian who will contact you.

If the veterinarian recommends you return for a recheck, please return to our Leeu Naylor Medical Building. *An appointment is not required for rechecks.*
